Section 1 : Coding

1. Problem Statement

Ravi is developing a student registration system for a college. To efficiently store and manage the student IDs, he decides to implement a doubly linked list where each node represents a student's ID.

In this system, each student's ID is stored sequentially, and the system needs to display all registered student IDs in the order they were entered.

Implement a program that creates a doubly linked list, inserts student IDs, and displays them in the same order.

Input Format

The first line contains an integer N the number of student IDs.

The second line contains N space-separated integers representing the student IDs.

Output Format

The output should display the single line containing N space-separated integers representing the student IDs stored in the doubly linked list.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 5
10 20 30 40 50
Output: 10 20 30 40 50

Answer

```
#include<stdio.h>
#include<stdlib.h>
struct node{
   int id;
   struct node*prev;
   struct node*next;
};
struct node*head=NULL;

void append(int id){
   struct node*newNode=(struct node*)malloc(sizeof(struct node));
   newNode->id=id;
   newNode->prev=NULL;
   newNode->next=NULL;

   if(head==NULL){
      head=newNode;
   }else{
      struct node*temp=head;
      while(temp->next!=NULL){
        temp=temp->next;
      }
      temp->next=newNode;
      newNode->prev=temp;
```

```
    }
}

void display(){
    struct node*temp=head;
    while(temp!=NULL){
        printf("%d",temp->id);
        temp=temp->next;

    }
    printf("\n");

}
int main(){
    int n,id;
    scanf("%d",&n);
    for(int i=0;i<n;i++){
        scanf("%d",&id);
        append(id);
    }
display();
return 0;
}
```

Status : Correct ***Marks : 10/10***
